Outer loop: plan a study, choose each round of runs, stop at the goal
brief: a question
planner writes a plan
plan check; a person approves
proposer picks a round: the agent, rules or a baseline
run check: legal scene, knobs
not met: next round
goal check: 5 hardest confirmed?
met
triage explains each failure
report answers the brief; code writes every number
every run
Inner loop: check every run before and after it runs; keep it or heal it
kept outcomes
kept, with its outcome (the policy's failures only)
pass
postflight: settings landed, knobs verified, physics, rules
the policy drives in closed loop
preflight + machine check: config legal, GPU, disk
each batch
every later run
fail
retry
batch audit flags runs, proposes rules
rule admitted by code; a person enacts it
investigator picks one of five skills
validator, then the recovery script
HALT
halted: a person
the agent proposes
plain code checks and acts
a person
the simulator
